

Weekly Report

Group: 4A **Date:** 2026-09-21

Achievements:

What were your achievements of the past week?

To be fair we did not achieve so much this week. We were assigned to project 4 (document retrieval using LLMs and RAG) with Professor Georgios Fakas as supervisor. We tried to have our first meeting with him but it did not work out, so it was rebooked to today. Besides that we have not started with the actual work yet.

Problems:

What kind of problems or difficulties did you face the last week? Did you manage to solve them?

The main difficulty last week was that our first meeting with the supervisor had to be rebooked, which delayed our understanding of the project scope and expectations. However, we had the meeting with Professor Fakas today (21/9), where we discussed the project direction and received guidance on the topics and literature we should focus on. This has given us a clearer direction for the next steps.

Meetings:

How many meetings did you have as a group and who attended? Did you meet your supervisor(s) this week?

We had one meeting as a group and all three members attended (Nazmus, Yifan and William). It was supposed to be our first meeting with the supervisor, Professor Georgios Fakas, but it failed so we did not meet him this week. The meeting happened today with him.

Project Diary:

For each member of the group, note the number of hours worked and the activities that these hours were spent on.

- Nazmus Sadat Samin: 1h, the planned first meeting with our supervisor.
- Yifan Deng: 1h, the planned first meeting with our supervisor.
- William Degrér: 1h, the planned first meeting with our supervisor.

Plan:

- Read and prepare approximately one page of related work on diversity and proportionality, with a focus on both spatial and non-spatial data.
- Study the attached paper on verification of spatial data and understand its methodology, research problem, and key findings.
- Explore the literature on AI Trustworthiness and identify related work that addresses similar problems or ideas to the attached paper, considering both spatial and non-spatial data.

- Compare the existing approaches and identify limitations, gaps, and possible opportunities for improvement, particularly regarding the use of LLMs/RAG.
- Based on our literature review and understanding of the existing work, the three of us will discuss and develop possible project ideas and decide on a concrete research direction.

Contact person of the week:

This is the person we should contact if we have any further questions.

William Degrér
